SHAHZER NAJEEB

SENIOR FULL-STACK SOFTWARE ENGINEER

Current Location: India | **Email:** shahzer.naj@gmail.com | **Website:** horizon.shahzer.dev

Github: github.com/shahz-n | **LinkedIn:** linkedin.com/in/m-shahzer-najeeb | **Phone:** +91 7860536423

PROFESSIONAL SUMMARY

Senior Full-Stack Software Engineer and former **Founding Engineer & Tech Lead** with over **6** years of experience architecting and building production systems across multiple domains, including **Fintech**, **HR-Tech**, and **Marketplace** platforms, spanning **early-stage startups** to **large enterprises**. Experienced in leading end-to-end product development, designing scalable backend services, APIs, distributed systems, and data-intensive applications, alongside complex frontend applications, interactive experiences, and real-time interfaces. Comfortable navigating unfamiliar problem domains, adapting to different technical requirements, and taking products from initial concepts through production.

TECHNICAL SKILLS

Programming Languages — JavaScript · TypeScript
Backend — Node.js · Express · NestJS · REST APIs · GraphQL · Redis · RabbitMQ · Kafka · Real-Time Systems · WebSockets · RAG · Microservices · System Design · Distributed Systems
Frontend — React · Next.js · Tailwind CSS · Redux · Zustand · Svelte · Three.js · React Native · CSS · HTML · WebGL
Databases — PostgreSQL · MySQL · Microsoft SQL Server · MongoDB · SQL · NoSQL
Cloud & Tools — AWS (Amazon Web Services) · Google Cloud Platform · Docker · Kubernetes · Linux · Serverless · Supabase · Firebase · CI/CD · Git

PROFESSIONAL EXPERIENCE

NymCard — Abu Dhabi, UAE · Fintech · Jan 2026 - Jun 2026

Senior Software Engineer (Remote) — *Node.js · Express · React · GraphQL*

- Owned end-to-end development of features for Nym4Business, a **multi-tenant B2B financial platform** serving SMEs and organizations.
- Developed a **configurable transaction approval system** supporting conditional rules, multi-level approvals, and role/user based authorization.
- Implemented **two-factor authentication, audit-logging mechanisms,** and **card-issuing workflows** integrated with NymCard's core payment systems.

Moback — Bangalore, India · HR-Tech · Dec 2024 - Jan 2026

Senior Software Engineer (Remote) — *Node.js · NestJS · TypeScript · SQL Server*

- Developed core backend services powering Korn Ferry Talent Suite, a global HR-Tech platform serving thousands of organizations across 150+ countries.
- Engineered an **internal service-discovery and request-routing system** that periodically scanned services, aggregated route maps, and dynamically translated outgoing requests, reducing inter-service latency by up to **70%** and overall request latency by up to **40%**, without requiring changes to individual service handlers.
- Architected a **real-time streaming export pipeline** for multi-gigabyte audit logs, generating and streaming CSV exports directly to clients without intermediate server-side files, minimizing memory consumption and eliminating generated-file storage overhead.

- Designed an **advanced hierarchical request-tracing system** capturing nested execution flows, operation-level timings, and contextual metadata across database and HTTP calls, with minimal overhead in request-processing pipelines.

BorrowBe — Edmonton, Canada · Marketplace · Dec 2022 - Dec 2024

Founding Engineer & Tech Lead (Remote) — *Express · React · React Native · MongoDB*

- Led the engineering of a **two-sided marketplace platform** from initial design through production launch, owning core backend and frontend architecture while leading a team of three.
- Designed a **dynamic inheritance-based CMS** with a hierarchical category system, allowing categories and subcategories to be created with independently configurable listing attributes, pricing packages, and limits, while inheriting or selectively overriding parent configurations.
- Engineered a **hybrid geospatial and address-based search system** using MongoDB geospatial queries and custom distance calculations to support map-based discovery, radius searches, and structured address filtering.
- Built a **real-time communication system** using Socket.IO, with per-listing chat rooms, custom presence tracking, reconnection handling, typing indicators, media messaging, and real-time notifications.
- Architected a **Stripe-integrated wallet and recurring payments system**, implementing a hybrid transaction ledger supporting direct payments, account credits, and automated subscription renewals.

Independent / Freelance — New Delhi, India · Multiple · Feb 2020 - Dec 2022

Full-Stack Engineer (Remote) — *React · Express · TypeScript / JavaScript · Node.js*

- Mentored **100+ developers worldwide**, providing technical guidance across software engineering, full-stack development, and system design, from foundational programming to advanced engineering concepts.
- Designed and delivered **end-to-end full-stack applications** across the TypeScript and JavaScript ecosystems, spanning React, Next.js, React Native, Node.js, Express, GraphQL, and more.
- Delivered products across diverse domains, including gaming companion applications, tournament management platforms, educational technology, and more.

PROJECTS

Context Studio — AI Knowledge & Content Workspace

Next.js · TypeScript · Supabase · Redux · Anthropic · OpenAI · PostgreSQL & PgVector

- Architected a **fault-tolerant, idempotent document-ingestion pipeline** for serverless environments, combining database-backed queues, expiring leases, multi-stage parallel workers, and recovery mechanisms to handle instance recycling.
- Built a **hybrid retrieval system** that dynamically routes between lexical and vector search based on query length, interleaving results where both are effective.
- Built a **feedback-driven research-brief system** with adaptive topic and source weighting, carrying user feedback into generation state to continuously refine subsequent briefs delivered through cron-based generation.

Astrarium — Real-Time, To-Scale 3D Orrery

Three.js · Svelte · TypeScript · WebGL · GLSL

- Built a **to-scale 3D orrery** inspired by NASA's "Eyes on the Solar System", including all planets, dwarf planets, and major moons, based on real astronomical data.
- Designed a **Keplerian orbital-motion engine** with true-to-scale velocity, live orbit and label tracking, motion trails, and a custom clock and time system scaling from real time to several years per second.
- Developed and published an **npm package** for **high-precision line rendering**, using custom shaders and camera-relative coordinates to eliminate GPU floating-point jitter at astronomical scales.
- Built **three custom camera systems**, including a six-axis free-flight mode, rebuilding Three.js's native orbit controls from scratch to handle extreme time-scale chase scenarios.

CERTIFICATIONS

ITPEC Fundamental Information Technology Engineer (FE)

LANGUAGES

English — Bilingual / Native

Japanese — Conversational (JLPT N3)
